Motional EMF

Conducting rod moving across region of uniform magnetic field

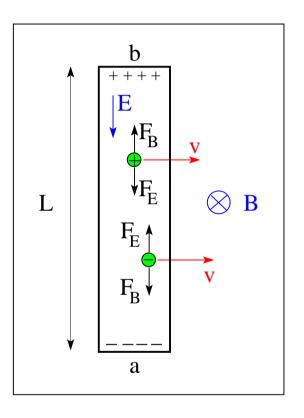

- moving charge carriers
- magnetic force $\vec{F}_B = q \vec{v} \times \vec{B}$
- charge separation
- electric field \vec{E}
- electric force $\vec{F}_E = q\vec{E}$

$$F_E = F_B \quad \Rightarrow \ qE = qvB \quad \Rightarrow \ E = vB$$

Potential difference induced between endpoints of rod:

 $V_{ab} \equiv V_b - V_a = EL \implies V_{ab} = vBL \pmod{\text{EMF}}$

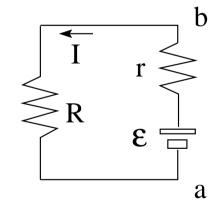

Current Produced by Motional EMF

- Motional EMF: $\mathcal{E} = vBL$
- Terminal voltage: $V_{ab} = \mathcal{E} Ir$
- Electric current: $\mathcal{E} Ir IR = 0 \Rightarrow I = \frac{\mathcal{E}}{r+R}$
- Applied mechanical force: \vec{F}_{app}
- Magnetic force: $\vec{F}_B = I\vec{L} \times \vec{B}$
- Motion at constant velocity: $\vec{F}_{app} = -\vec{F}_B$
- Electrical power generated: $P_{gen} = \mathcal{E}I$
- Mechanical power input: $P_{in} = Fv = (ILB)v = (vBL)I = \mathcal{E}I$
- Electrical power output: $P_{out} = V_{ab}I = \mathcal{E}I I^2r$

Prototype: motional EMF reformulated.

- Choose area vector \vec{A} for current loop: A = Ls \bigcirc .
- Magnetic flux: $\Phi_B = \int \vec{B} \cdot d\vec{A}$. Here $\Phi_B = -BLs$.
- Motional EMF: $\mathcal{E} = vBL$.
- Change in area of loop: dA = Lds.
- Change in magnetic flux: $d\Phi_B = -BdA = -BLds$.
- SI unit of magnetic flux: 1Wb=1Tm² (Weber).
- Rate of change of flux: $\frac{d\Phi_B}{dt} = -BL\frac{ds}{dt} = -vBL$. • Faraday's law: $\mathcal{E} = -\frac{d\Phi_B}{dt}$. • $\mathbb{E} = -\frac{d\Phi_B}{dt}$.

Magnetic flux and Faraday's law

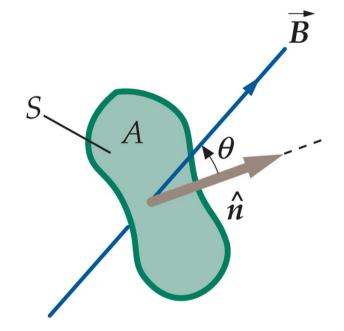

inin ĝana

- Magnetic field \vec{B} (given)
- Surface *S* with perimeter loop (given)
- Surface area A (given)
- Area vector $\vec{A} = A\hat{n}$ (my choice)
- Positive direction around perimeter: ccw (consequence of my choice)

• Magnetic flux:
$$\Phi_B = \int \vec{B} \cdot d\vec{A} = \int \vec{B} \cdot \hat{n} dA$$

- Consider situation with $\frac{d\vec{B}}{dt} \neq 0$
- Induced electric field: \vec{E}
- Induced EMF: $\mathcal{E} = \oint \vec{E} \cdot d\vec{\ell}$ (integral ccw around perimeter)

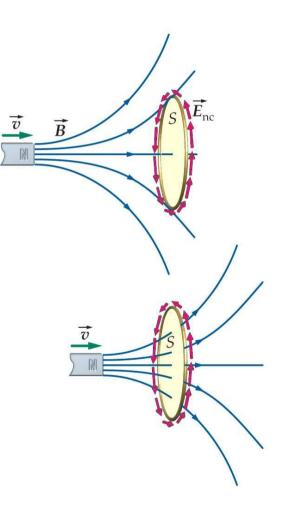

• Faraday's law:
$$\mathcal{E} = -rac{d\Phi_B}{dt}$$

Faraday's Law of Induction (2)

Here the change in magnetic flux Φ_B is caused by a moving bar magnet.

- Assume area vector \vec{A} of loop pointing right. Hence positive direction around loop is clockwise.
- Motion of bar magnet causes $\frac{d\Phi_B}{dt} > 0.$
- Faraday's law: $\mathcal{E} = -\frac{d\Phi_B}{dt}$.
- Induced EMF is in negative direction, $\mathcal{E} < 0$, which is counterclockwise.
- Induced EMF reflects induced electric field: $\mathcal{E} = \oint_C \vec{E} \cdot d\vec{\ell}$.
- Field lines of induced electric field are closed.
- Faraday's law is a dynamics relation between electric and magnetic fields: $\oint_C \vec{E} \cdot d\vec{\ell} = -\frac{d}{dt} \int_S \vec{B} \cdot d\vec{A}$.

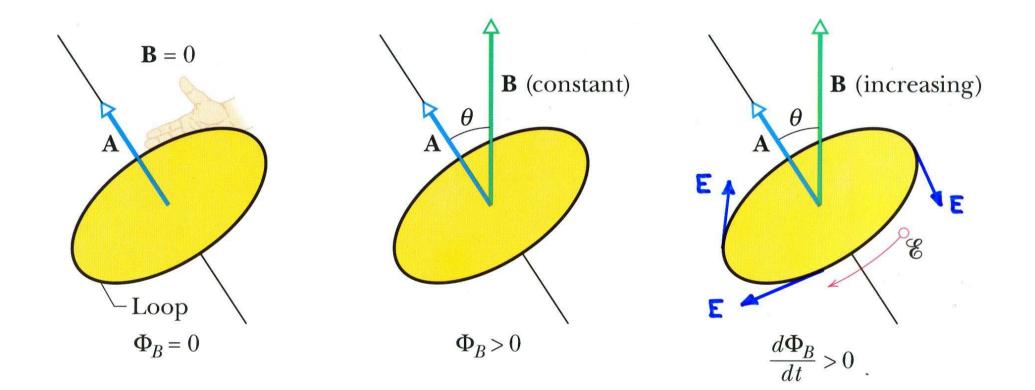

Area – Field – Flux – EMF (1)

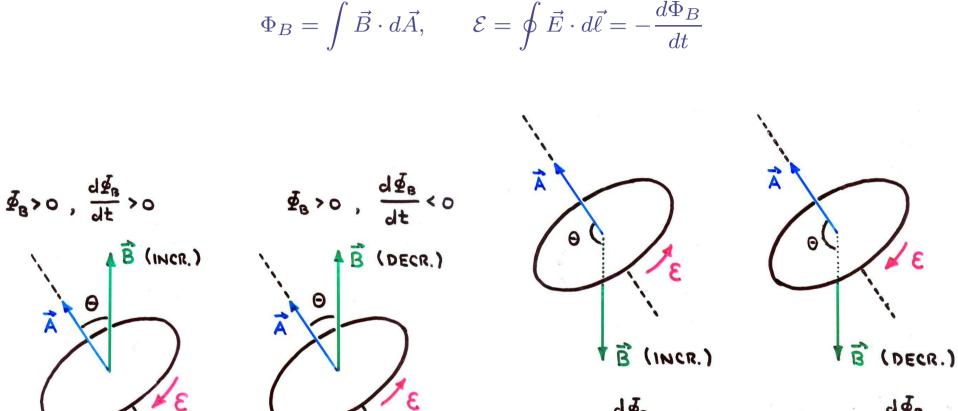

Area – Field – Flux – EMF (2)

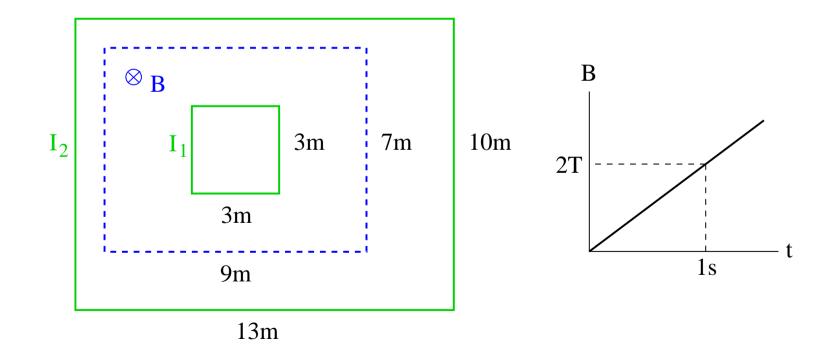

A uniform magnetic field \vec{B} pointing into the plane and increasing in magnitude as shown in the graph exists inside the dashed rectangle.

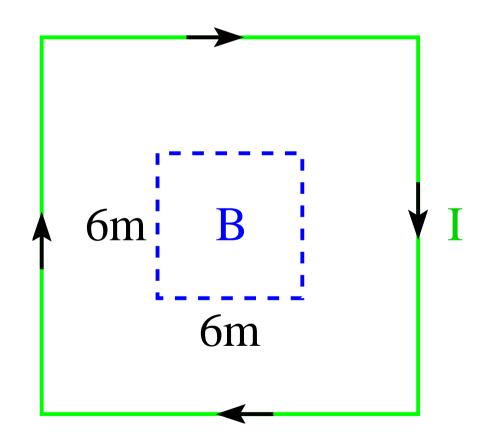

• Find the magnitude (in amps) and the direction (cw/ccw) of the currents I_1, I_2 induced in the small conducting square and in the big conducting rectangle, respectively. Each conducting loop has a resistance $R = 9\Omega$

A magnetic field \vec{B} of increasing strength and directed perpendicular to the plane exists inside the dashed square. It induces a constant clockwise current I = 8A in the large conducting square with resistance $R = 9\Omega$.

• If $\vec{B} = 0$ at time t = 0, find the direction (\odot, \otimes) and magnitude of \vec{B} at time t = 5s.

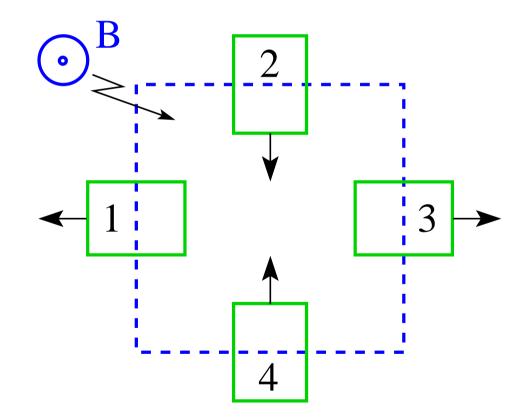

Magnetic Induction: Application (5)

A uniform magnetic field \vec{B} pointing out of the plane exists inside the dashed square. Four conducting rectangles 1,2,3,4 move in the directions indicated.

• Find the direction (cw,ccw) of the current induced in each rectangle.

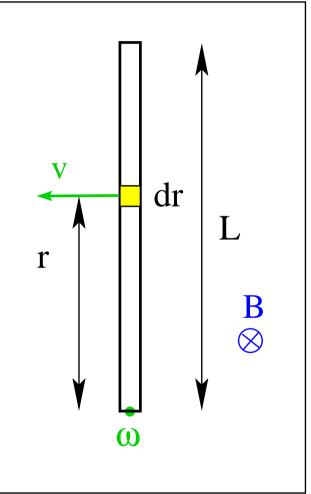

Magnetic Induction: Application (9)

Consider a conducting rod of length L rotating with angular velocity ω in a plane perpendicular to a uniform magnetic field \vec{B} .

- Angular velocity of slice: ω
- Linear velocity of slice: $v = \omega r$
- EMF induced in slice: $d\mathcal{E} = Bvdr$
- Slices are connected in series.
- EMF induced in rod:

$$\mathcal{E} = \int_0^L Bv \, dr = B\omega \int_0^L r \, dr$$
$$\Rightarrow \mathcal{E} = \frac{1}{2} B\omega L^2 = \frac{1}{2} Bv L$$

Lenz's Rule (1)

The induced emf and induced current are in such a direction as to oppose the cause that produces them.

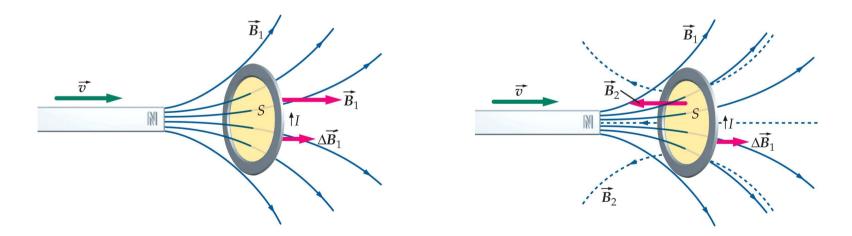

- Lenz's rule is a statement of negative feedback.
- The cause is a change in magnetic flux through some loop.
- The loop can be real or fictitious.
- What opposes the cause is a magnetic field generated by the induced emf.
 - If the loop is a conductor the opposing magnetic field is generated by the induced current as stated in the law of Biot and Savart or in the restricted version of Ampère's law.
 - If the loop is not a conductor the opposing magnetic field is generated by the induced electric field as stated by the extended version of Ampère's law (to be discussed later).

Lenz's Rule (2)

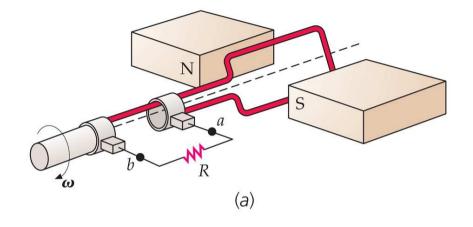

In the situation shown below the current induced in the conducting ring generates a magnetic field whose flux counteracts the change in magnetic flux caused by the bar magnet.

- Moving the bar magnet closer to the ring increases the magnetic field \vec{B}_1 (solid field lines) through the ring by the amount $\Delta \vec{B}_1$.
- The resultant change in magnetic flux through the ring induces a current *I* in the direction shown.
- The induced current *I*, in turn, generates a magnetic field \vec{B}_2 (dashed field lines) in a direction that opposes the change of flux caused by the moving bar magnet.

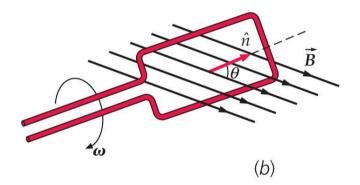

AC Generator

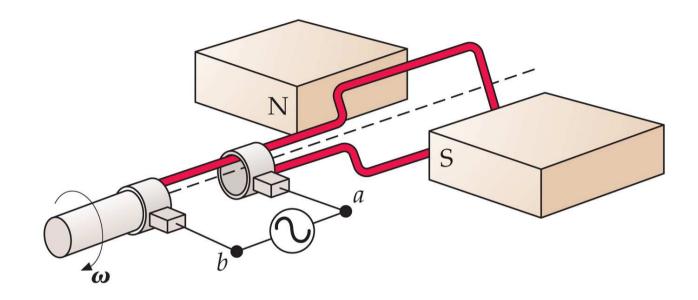

- Area of conducting loop: A
- Number of loops: N
- Area vector: $\vec{A} = A\hat{n}$
- Magnetic field: \vec{B}
- Angle between vectors \vec{A} and \vec{B} : $\theta = \omega t$
- Magnetic flux: $\Phi_B = N\vec{A} \cdot \vec{B} = NAB\cos(\omega t)$
- Induced EMF: $\mathcal{E} = -\frac{d\Phi_B}{dt} = \underbrace{NAB\omega}_{\mathcal{E}_{max}} \sin(\omega t)$

AC Motor

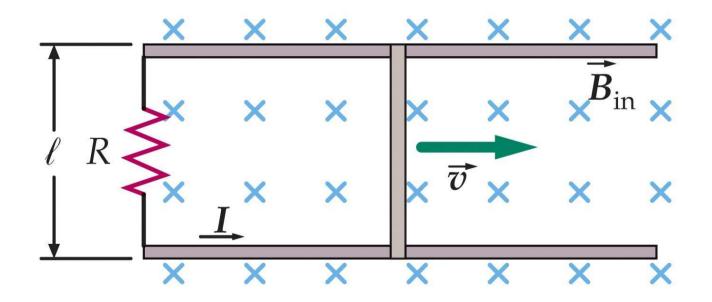

- Power source produces alternating current (ac) in loop.
- Current exerts torque on loop.
- Torque initiates and maintains rotation.
- Rotating loop induces back emf (counteracting source emf).

Consider a rectangular loop of width ℓ in a uniform magnetic field \vec{B} directed into the plane. A slide wire of mass m is given an initial velocity \vec{v}_0 to the right. There is no friction between the slide wire and the loop. The resistance R of the loop is constant.

- (a) Find the magnetic force on the slide wire as a function of its velocity.
- (b) Find the velocity of the slide wire as a function of time.
- (c) Find the total distance traveled by the slide wire.

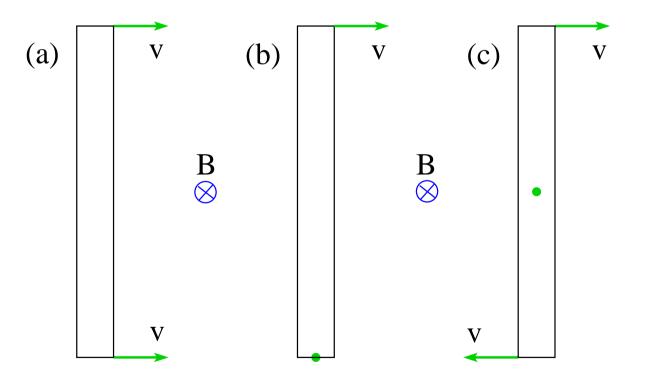

Magnetic Induction: Application (1)

Consider three metal rods of length L = 2m moving translationally or rotationally across a uniform magnetic field B = 1T directed into the plane. All velocity vectors have magnitude v = 2m/s.

• Find the induced EMF \mathcal{E} between the ends of each rod.

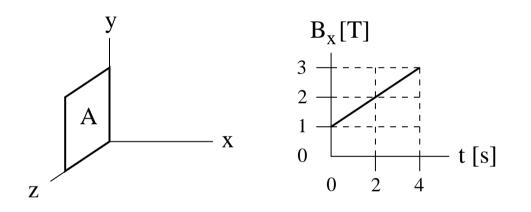

A conducting loop in the shape of a square with area $A = 4m^2$ and resistance $R = 5\Omega$ is placed in the *yz*-plane as shown. A time-dependent magnetic field $\mathbf{B} = B_x \hat{\mathbf{i}}$ is present. The dependence of B_x on time is shown graphically.

(a) Find the magnetic flux Φ_B through the loop at time t = 0.

(b) Find magnitude and direction (cw/ccw) of the induced current I at time t = 2s.

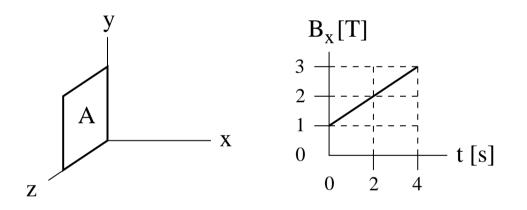

A conducting loop in the shape of a square with area $A = 4m^2$ and resistance $R = 5\Omega$ is placed in the *yz*-plane as shown. A time-dependent magnetic field $\mathbf{B} = B_x \hat{\mathbf{i}}$ is present. The dependence of B_x on time is shown graphically.

(a) Find the magnetic flux Φ_B through the loop at time t = 0.

(b) Find magnitude and direction (cw/ccw) of the induced current I at time t = 2s.

Choice of area vector: $\odot / \otimes \Rightarrow$ positive direction = ccw/cw.

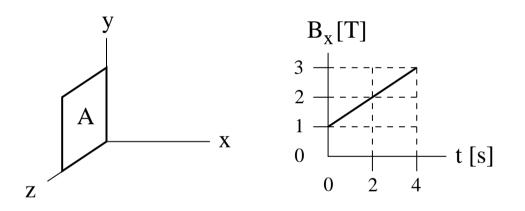

(a) $\Phi_B = \pm (1T)(4m^2) = \pm 4Tm^2$.

A conducting loop in the shape of a square with area $A = 4m^2$ and resistance $R = 5\Omega$ is placed in the *yz*-plane as shown. A time-dependent magnetic field $\mathbf{B} = B_x \hat{\mathbf{i}}$ is present. The dependence of B_x on time is shown graphically.

(a) Find the magnetic flux Φ_B through the loop at time t = 0.

(b) Find magnitude and direction (cw/ccw) of the induced current I at time t = 2s.

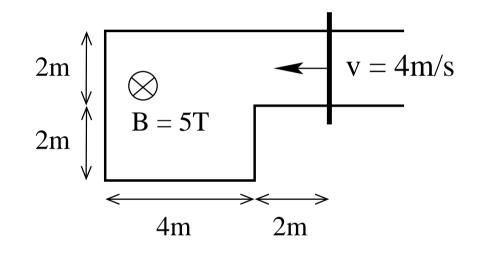

Choice of area vector: $\odot / \odot \Rightarrow$ positive direction = ccw/cw.

(a)
$$\Phi_B = \pm (1T)(4m^2) = \pm 4Tm^2$$
.
(b) $\frac{d\Phi_B}{dt} = \pm (0.5T/s)(4m^2) = \pm 2V \quad \Rightarrow \quad \mathcal{E} = -\frac{d\Phi_B}{dt} = \mp 2V.$
 $\Rightarrow I = \frac{\mathcal{E}}{R} = \mp \frac{2V}{5\Omega} = \mp 0.4A$ (cw).

A conducting frame with a moving conducting rod is located in a uniform magnetic field as shown.

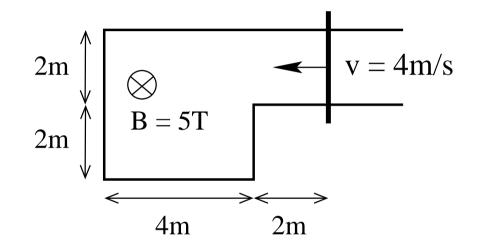

- (a) Find the magnetic flux Φ_B through the frame at the instant shown.
- (b) Find the induced emf \mathcal{E} at the instant shown.
- (c) Find the direction (cw/ccw) of the induced current.

A conducting frame with a moving conducting rod is located in a uniform magnetic field as shown.

- (a) Find the magnetic flux Φ_B through the frame at the instant shown.
- (b) Find the induced emf \mathcal{E} at the instant shown.
- (c) Find the direction (cw/ccw) of the induced current.

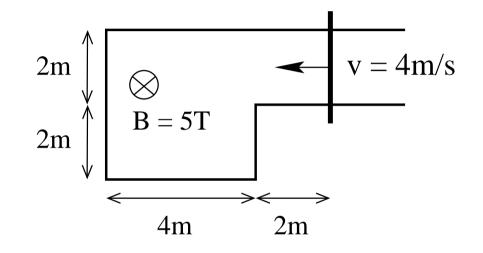

(a)
$$\Phi_B = \vec{A} \cdot \vec{B} = \pm (20 \text{m}^2)(5\text{T}) = \pm 100 \text{Wb}.$$

mujam

A conducting frame with a moving conducting rod is located in a uniform magnetic field as shown.

- (a) Find the magnetic flux Φ_B through the frame at the instant shown.
- (b) Find the induced emf \mathcal{E} at the instant shown.
- (c) Find the direction (cw/ccw) of the induced current.

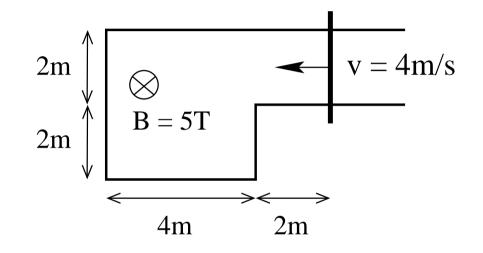

(a)
